

Stock Analysis Dashboard

Shahin Alakparov

Technical Task

- Problems:
 - Script was static and not interactive.
 - Hard-coded indicator parameters.
 - No dynamic UI, no visualization.
- Solution:
 - Needed to refactor code into modular library and build a "Vanilla" Front-End application

Approach

- Refactored logic into modular OOP backend.
- Created FastAPI REST API for dynamic data.
- Built Vanilla JS frontend with Chart.js.
- Real-time parameter adjustment.

Pipeline

- Load CSV stock data
- Apply selected indicators via classes
- Send results through API
- Frontend fetches & updates chart live

Features

- Fully interactive dashboard
- Adjustable MA, RSI, EMA, MACD, ATR, BB
- Multiple choice of indicators
- Real-time updating chart without page reload
- Real-time updating processed table
- Downloading CSV of processed data
- Clean scalable backend structure

Challenges

- Handling NaN/Infinity values
- Mapping UI selections to API params
- Ensuring that, there are no fetching errors
- Enabling real-time chart updating

Conclusion

- Converted static script into application to visualize the data.
- Scalable, modular Python architecture
- Clean UI with real-time interaction

Thank You!
